Software Developer with experience in production systems, specialized in Laravel and PHP. I have optimized web platforms, achieving improvements in load times and greater stability in critical environments. I apply good practices to build scalable and maintainable solutions, actively collaborating with multidisciplinary teams.

EXPERIENCIA PROFESIONAL

Eglocal One — PHP | Laravel Web Developer

September 2023 – Presente

- Developed and maintained in production a B2B SaaS for marketing agencies (Laravel 13, Vue.js and Inertia.js) with over 500 users, third-party integrations and payment gateways.
- Migrated images from Base64 to Amazon S3, reducing a 3 GB table to 330 MB and batch processing time from 50 to 20 seconds.
- Diagnosed a PHP 8.1 platform with load times of ~25 s: an abandoned script was loading synchronously and blocking the render until timeout. I removed it and alerted the team; load time dropped to 1–2 s.
- Detected an intrusion on a client's server (a Laravel 11 site affected by a known vulnerability). I audited the case and, after confirming the server was compromised, migrated the site to a clean server with an updated Laravel version and recovered the affected data.
- Developed interfaces with React and Tailwind and managed production VPS servers (PHP, MySQL, Nginx).

Paraná Steel — Software Developer (freelance, in parallel with Eglocal One)

May 2026 – July 2026

- Implemented a quoting and product management system integrated into the website, digitizing a manual process.
- Developed the web platform end-to-end as the sole developer: architecture design, backend/frontend and deployment.
- Operated the entire infrastructure on Contabo with continuous deployment via Coolify and Nginx, including DNS, SEO and automated daily backups with 7-day retention.
- Configured Telegram alerts for site downtime, backup failures and failed deploys, and blocked (403) the execution of malicious files with Nginx, such as PHP files with double extensions in public directories.
- Covered the main controllers and critical services with automated tests to reduce regressions on every deployment.

Stack: *Laravel, PHP 8.4, React, Tailwind, Nixpacks, Nginx, Coolify.*

GVR Solutions — Front-End Developer (freelance, Indian-based team)

January 2023 – August 2023

- Developed front-end features with React in a remote team, communicating in English and working with issues and pull requests on GitHub.
- Wrote unit tests with React Testing Library for the components I developed.
- Communicated in English during meetings and development work.

EDUCATION

Back-end with Node.js — UTN (2023) | Front-end React — Coderhouse (2022-2023) | Web development with Django — Coderhouse (2024)

TECHNICAL SKILLS

- **Languages:** Native Spanish and advanced English — experience collaborating with international teams.
- **Programming languages:** PHP, JavaScript
- **Frameworks and libraries:** Laravel, React, Vue (2 y 3), Inertia.js
- **Database and cache:** MySQL, PostgreSQL, SQLite, Redis
- **Infrastructure:** AWS, VPS, Linux, Nginx, Coolify
